PROFILE

Financial Engineer with experience in **business intelligence, data science, and software development**. I currently build Power BI dashboards, forecasting models, and the allocation of multi-million-peso sales quotas for a retail brand with over 400 points of sale. Over 9 years at a technology services company, I grew from repair technician to developing the system to digitize its operations. I have a strong foundation in quantitative finance and credit risk.

EDUCATION

Financial Engineering

ITESO Universidad Jesuita de Guadalajara

2022 – 2026

- **GPA: 95.0 / 100.**
- Relevant areas: quantitative finance, credit risk, econometrics, machine learning, data science, optimization, and programming.

Computer Systems Technologist

Escuela Politécnica de Guadalajara

2018 – 2022

- **GPA: 96.0 / 100.**
- Training in C programming and web development (HTML, CSS, and JavaScript).

SKILLS

Languages: Python, SQL, R, MATLAB, JavaScript, TypeScript, HTML, CSS

Tools: Excel (advanced, Solver), Power BI (Power Query, DAX), SQL Server, PostgreSQL, React, Django, Docker, Git, GitHub, Linux, Terminal (CLI)

Libraries: Pandas, NumPy, Matplotlib, Seaborn, SciPy, Statsmodels, Scikit-learn, LightGBM, Prophet, TensorFlow, yfinance

Applied AI: integration of AI tools into development and analysis workflows

KEY AREAS

Financial analysis · Credit risk · Business intelligence · Data analysis · Sales forecasting · Quantitative finance · Applied machine learning · Computer vision · Software development

LANGUAGES

Spanish: Native

English: Advanced

WORK EXPERIENCE

BI Data Associate

CLOE

August 2026 – Present

- Built **Power BI dashboards** from scratch for Retail, Commercial, and Product (SQL Server, Power Query, DAX), replacing Excel-based reports with self-service queries.
- Optimized the product dashboard by redesigning the data model and using Dual storage, cutting load time from ∼**120 s to ∼40 s (−67%)** and eliminating memory failures.
- Allocated the multi-million-peso annual sales quota across **370+ department stores** (Liverpool, Sears, Sanborns, El Palacio de Hierro) using historical weighting and Solver optimization.
- Ongoing development of an **ensemble of forecasting models** for daily sales across **54 company-owned stores**, incorporating weather, air traffic, seasonality, and holiday features to set store targets.
- Weekly and monthly reports for management on sales, conversion, and product sell-through, with **restocking alerts** for stores with under 2 months of inventory.

Financial Analyst

World Vest Base

May 2026 – July 2026

- Comprehensive evaluation of **150+ public companies** from Mexico, Chile, Argentina, and Colombia, including the analysis of their financial statements and of the qualitative factors that drive their performance.
- Structuring and cleaning of corporate information, ensuring the integrity and accuracy of the institutional database.
- Generation of analytical reports on each company's situation, providing strategic insights that support investment decisions.

Printing Area Technician and Software Development Lead

ASISA

2017 – 2026

- Diagnosis and repair of inkjet and dot-matrix printers (ink systems, encoders, feed rollers, bushings) and component-level UPS repair (soldering and battery replacement); promoted from quality control to lead of the printing area within one year.
- End-to-end development of an **internal management system** (React, TypeScript, Django, PostgreSQL, and Docker) to **digitize the service workflow** and replace paper work orders: customer check-in on a tablet, QR-coded work orders, assignment to work areas, tracking of diagnostics, turnaround times, and staff, and repair history by serial number; deployed on a **self-configured and administered Linux server** with remote SSH access. In its final development stage and **used by ∼8 employees**.
- Implementation of **data analytics and finance modules for management**, replacing Excel-based calculations, along with employee authentication, data encryption, and a **QR-based rewards program** linked to each customer.

PROJECTS

Mean-Reverting Portfolio

PAP – Professional Application Project

- Construction in Python of portfolios using groups of **cointegrated** assets whose prices tend to move together and revert to an equilibrium value.
- Definition of buy and sell rules and validation of the strategy on historical data across different market periods.
- **Result:** low-risk investment alternative with ∼**8.8% annual return**, a Sharpe of **1.18**, and a maximum drawdown of 18%.

Automated Fruit Classifier with Computer Vision

Academic project – Technology Solutions Lab, ITESO

- Design and implementation of a fruit classification system (cherry, strawberry, raspberry, and empty belt) on an industrial conveyor belt, using a **commercial webcam** as a low-cost alternative to specialized industrial cameras; modular software developed in MATLAB.
- Event-driven real-time architecture: background-subtraction detection with geometric filters, a state machine with a *pre-trigger* buffer, and dynamic background adaptation with automatic reset under lighting changes, **eliminating false detections caused by the metal belt** (initially one false event every ∼3 s).
- **Custom CNN architecture** (4 convolutional blocks) trained on CPU with a dataset of **4,545 images** captured on the real belt, with geometric and color (HSV) data augmentation and a fixed stratified split to prevent data leakage.
- **Result: 93.7% test accuracy** (100% recall on empty belt and above 93% on cherry and raspberry), 1:1 fruit detection on the belt with no false positives, and **0.4–0.6 s latency per event without a GPU**.

Credit Risk Model

Academic and personal project

- Development in Python of an **interpretable credit risk score** in the style of the Altman Z-Score: construction of 11 financial ratios (indebtedness, payment burden, balance coverage, savings) and variable selection by statistical significance (logistic regression), correlation, and VIF.
- Optimization of the score weights via Monte Carlo, differential evolution, and *dual annealing*, validated on a train/validation/test scheme.
- **Result:** ∼**78% accuracy** and **ROC-AUC of 0.75** on test data, with a predicted default rate of 29.1% vs. an actual 29.0%.

Corporate Credit Valuation

Academic project presented at Citi Banamex

- Analysis of a publicly traded company using liquidity ratios (current ratio, quick ratio), leverage (debt-to-equity, net debt/EBITDA), interest coverage, and cash flow, benchmarked against peers in the same sector.
- **Result:** credit recommendation with proposed financing terms, presented to Citi Banamex.
